Volumetric Concrete Dispenser – in a precast works.

What is a Volumetric Concrete Dispenser?

The Armcon Volumetric Concrete Dispenser is a mobile or static self contained concrete batching plant. It holds the raw materials in separate hoppers which can be mixed on site as and when required.

What can it do for me?

Our system allows for different concrete designs to be mixed on demand from the same fill of materials to the precise quantity required with no waste. Meaning you can mix as little as one concrete slab if desired.

Is it easy to use?

These mixers are very easy to use with fresh concrete supplied with just a push of a button or a pull of a lever.

What materials do I need?

Most types of aggregate can be used included recycled materials. Our dedicated Service Team will calibrate your machine to whichever material you currently use and give you technical advice on mix designs and additives.

How much space will I need?

The static concrete dispenser is designed with the precaster in mind, with various sizes available to suit your business requirements. Our smallest mixer holds 2 metres of concrete materials and is no larger than a small skip.

Our team will conduct a full site inspection to assess the best place for a mixer and how it will be connected to a water and electricity supply.

Why Armcon?

Armcon are the largest supplier of volumetric mixers in Europe, backed by customer after sales support which is second to none. Our market leading volumetric mixers are designed and built to last and give outstanding years of service.

What will it mean for my business?

An Armcon mixer will give you total flexibility and allow you to achieve greater control over your own use concrete needs without the associated costs and prices demanded by traditional ready-mix companies. You will not have to wait for concrete to be delivered and your concrete will always be fresh.

Makes production more efficient you can fill moulds direct from the mixer, meaning you can double your output

The Armcon Volumetric Mixer will reduce your cement content saving you money and will enable you to add admixtures easily to your mix.
